Stage 5 Trust and Success codebook

Supports §5.2 (Stage 5 answers) and §6. The codes for the requirements named in the survey's Stage 5 answers on trust and on success (59 contributors each). The article names the codes in plain words: where an answer came from (`PROVENANCE`), accuracy (`ACCURACY`), privacy (`PRIVACY`), timeliness (`TIMELINESS`), actionable answers (`ACTIONABILITY`), admitting limits (`HONESTY_LIMITS`), ease of use (`EASE`), other (`OTHER`) and none (`NONE`).

The codebook was last edited on 14 October 2026. Its "Procedure" section is the plan written before coding. As §5.5 and Appendix D describe, an AI model proposed each code and the first author reviewed every proposal; no second coder coded this material, and the planned re-coding of a seeded 10% a week later was not done. "Pre-registered" means the study plan approved before the first session; it was not registered publicly (§5). Plan sections refer to the authors' project records.

Edits for anonymity: the first author's name became "the first author" (2 places).

Stage 5 Trust and Success codebook (tracker F4)

Material. The pre-development survey's Stage 5 free-text answers: 59 contributors answered the **Trust** question and 59 the **Success** question. **Unit = one contributor's answer**; counts are of people, never of keyword hits (v8 §4.3).

Why. The draft's figures (privacy 50%, provenance 40%, accuracy 36%) came from keyword matching. They are replaced by these human codes, and the paper says how the old figures were made. The coded requirements also become pre-registered expectations for RQ3 (does provenance shown in the evidence panel change decisions?).

Codes (multi-label; an answer can carry several)

Code	Apply when the person says trust or success depends on…	Constructed example
`PROVENANCE`	knowing where an answer came from, seeing the source, or an explanation of how it was reached	"I'd want to see which sensor it used"
`ACCURACY`	answers being correct, matching reality, or verified	"It has to be right every time"
`PRIVACY`	not exposing people, personal data or occupancy of individuals	"It shouldn't tell anyone where I sit"
`TIMELINESS`	data being current or answers fast	"Old readings are useless"
`ACTIONABILITY`	answers that lead to something the person can do	"Tell me which room to go to, not just numbers"
`HONESTY_LIMITS`	the system admitting what it doesn't know, or not guessing	"Say if you don't know"
`EASE`	ease of use, natural language, no training needed	"I shouldn't need to learn commands"
`OTHER`	anything else (name it in the note)	—
`NONE`	blank, off-topic or uninterpretable	—

Rules

- Code what is **stated**, not what is implied. "Reliable" alone = `ACCURACY`.
- `HONESTY_LIMITS` is coded only when the person refers to the system acknowledging limits, not when they want accuracy in general.
- Code Trust and Success answers separately, on separate sheets.

Procedure

1. The first author codes all 59 + 59 answers (`sheets/stage5_coding_sheet_TEMPLATE.csv`), blind to the old keyword labels. The second coder does not code this material (`Agreement_and_Adjudication_Procedure.md`), so the paper reports it as coded by one person.
2. To check consistency, the first author re-codes a seeded 10% one week later without looking at the first codes, and reports that intra-rater agreement as such.
3. Report per code: the number of **people** (out of 59), with a Wilson 95% interval, and one permission-checked example where consent allows quotation.
